

CASE STUDY 1

Floor Plans

HoneyBook's first native floor planning tool, built for its highest-value vertical.

↳ Overview

Venues are one of HoneyBook's highest-revenue verticals and the one most likely to need a floor plan for every event they book. Without a native tool, they were cobbling together workflows across Canva, Prismm, and AllSeated. HoneyBook had the booking data, the client portal, and the relationship. It was missing the tool.

↳ My Role

End-to-end product design: competitive research, user journey mapping, UX/UI, design QA, and V2 scoping.

↳ Objective

Build a native floor planning tool inside the HoneyBook project workflow, connected to CRM data competitors don't have, and give venues a reason to stop looking elsewhere.

↳ The Venue Vertical

Venues book more events per year than almost any other member type. More projects, more clients, more revenue per account.

They were also the segment most at risk. Prismm and Social Tables were actively targeting them, and floor planning was HoneyBook's biggest gap.

HoneyBook responded by assigning a dedicated support team to the venue vertical — and by building the tool they needed most.

"I would LOVE to see a floor plan feature that could be used on the platform successfully."

↳ The Problem

For venues, floor planning was a whole separate job. Build something in Canva or Prismm, export it, email it, get feedback, update it, send it again. Then show up on event day and hope everyone has the same version.

Every event. Every time. And another subscription to pay for.

Research and competitive analysis

April 2026

↳ Research and Findings

We ran a competitive analysis across 13 tools, mapped the full venue workflow end to end, and interviewed early users to understand where things were breaking down.

Version confusion was the biggest pain. Nobody knew which PDF was current. Clients had one version, coordinators had another, staff had a printed copy from two weeks ago.

Venues think in two modes. Setting up a space once, then adjusting it per booking. Most tools didn't account for that distinction.

HoneyBook had an edge nobody else had. Guest counts, contracts, client relationships. All the context a floor plan needs, already in the system.

↳ Workspace UX

Before designing, I mapped out how floor plans would live inside a HoneyBook project. The key decisions: a three-status model that separates prepping from sharing, two completely distinct experiences for venues and clients, and a create flow that surfaces templates from the start so venues aren't rebuilding the same room every booking.

↳ Design in Figma

Everything designed in Figma before engineering started.

- Full workspace UX and builder flows
- Publish, share, and status states
- Client portal and mobile app
- Templates
- Design QA

↳ Workspace UX

Floor plans live inside the HoneyBook project as their own tab. From there, venues can create, manage, and share plans without leaving the platform.

The floor plans tab. A dedicated space inside every project. Empty state makes the first action obvious.

Floor plan card. Shows the plan name, space name, status badge, and thumbnail at a glance.

↳ The Builder — V1

The V1 builder was intentionally scoped as an MVP. We knew it wasn't the full picture, but we wanted to get it in front of real users, learn from how they used it, and refine from there.

At launch it went out to 30% of venue members.

- 1. Element panel** — Furniture, shapes, rooms, and text. Organized by category, drag or click to place.
- 2. Status bar** — Shows the floor plan name, project, and current publish status at a glance.
- 3. Canvas** — Infinite grid with a 1'x1' scale indicator. Build freely, set scale once.
- 4. Set scale** — Calibrate the grid to match real-world room dimensions.

↳ Member Feedback

We launched to 30% of venue members and immediately reached out for feedback. 11 members responded. The signal was clear.

No real room dimensions / scale (63%).

The single biggest reason people weren't switching from their current tools.

No venue template / blueprint upload (54%).

Members wanted to start from a fixed layout, not draw walls from scratch every time.

Templates / reusability (36%).

Save once, reuse per booking.

Wall tool is confusing (27%).

The interaction model didn't match expectations.

Missing object types (45%).

Dance floors, bars, podiums, screens. The library was too sparse for real event use.

Items can accidentally move (18%).

No way to lock elements in place.

Hi Tal!

Thank you for reaching out! I'm happy to give some feedback.

In my 14 years of business, I have only used one other floorplan software: AllSeated. In my opinion, that software was a blueprint floor plan from the venue so that the objects you added to the plan were to scale. Since then, most of the time I design to the new Honeybook one where I am freehand drawing a plan. This makes it a little more challenging to ensure

While I am so excited that Honeybook now has this feature, and I ABSOLUTELY plan to use it a ton, I do wish there was a way to assure I'm creating a plan that is to scale and accounts for things like mid-room pillars and rooms that may not be perfectly rectangular. I do appreciate the feature, I do appreciate the feature.

One other note is that each table will be a different size.

Nonetheless,

Kerrigan Constantino

Wedding & Event Planner · kerr.planning@gmail.com

Hi Tal,

My initial thoughts was that it was missing many of the elements I needed to make a proper floor plan. Some of the things I did not see upon initial use:

- there was no ability to create a rectangle or shape in the exact dimensions I needed (example: a room that is 21x21' square, etc.)
- there were no items like "dance floors", "bars" etc. I went to create a dance floor, but again, it was not a dance floor because I couldn't tell if I scaled the dimensions of the room appropriately.
- even if I did put time and effort into making the floor plan on this platform, there wasn't going to be a way to lock it in place. Not a deal breaker, but just an added thought here.

Overall, I would LOVE to see a floor plan feature that could be used on the platform successfully. I would love to see a floor plan feature that could be used on the platform successfully and my "go-to".

Thank you for asking for my input!

↳ Turning feedback into product direction

I helped align Product, Engineering, and the venue team around what to ship first—and what would make the product genuinely competitive.

Aligned the MVP

Focused V1 on the core builder experience so we could launch quickly and learn from real venue workflows.

Set the V2 priorities

Turned member feedback into a clear roadmap centered on scale, blueprint uploads, templates, and precision.

Protected the product vision

Partnered with engineering through build and QA to keep the experience connected to HoneyBook’s project workflow—not just a standalone tool.

V2 IMPROVEMENTS

↳ Templates

Templates was one of the most requested features from early users. Venues wanted to build a room once and reuse it across every booking, without starting from scratch each time.

Save as template. One click from inside the builder saves the layout to the account-level library.

Floor plan templates tab. Lives under My Templates alongside file and email templates.

Create from template. When starting a new floor plan, pick an existing template as the starting point.

V2 IMPROVEMENTS

↳ Builder: Addressing scale and dimensions issues

7 out of 11 members said scale was the single biggest reason they couldn't switch to HoneyBook. We fixed it.

Upload blueprint + set scale. Upload your venue's actual floor plan and calibrate the canvas to real-world dimensions.

Ruler on canvas. Horizontal and vertical rulers that update as you build, always showing real measurements.

Dimensions indicator: Live dimensions appear when you select any element. No more guessing if a table is actually 60 inches.

V2 IMPROVEMENTS

↳ Builder: Control and precision

The rest of the improvements focused on making the builder feel more precise and polished.

Wall tool. Redesigned interaction model. Click, drag, click. Auto-ruler shows dimensions as you draw each segment.

Ruler tool. Drag to measure any distance on the canvas in real-world units. Stays on canvas as a reference.

Scale legend. Fixed to the canvas, always visible, always in sync with the ruler.

↳ Final Design

↳ Early Numbers & Impact

Launched June 10 with no marketing push. Members found it on their own. Opened to 100% of venue members on July 5. First marketing push starts now. These numbers were built entirely on organic discovery. See below as of July 7, 2026, day 27 since launch.

What we're watching

- Activation rate as full rollout builds signal.
- Share and publish rates as more members complete the full flow.
- Two messaging gaps being addressed. Prismm integration confusion and plan eligibility copy.
